

ASCSearch Service Level Agreement (SLA)

ASCSearch is a search engine service that allows users to search for and retrieve information. This document describes the availability and performance commitments the ASCSearch team makes to its users.

Covered Service

The following components are covered by this SLA:

- REST API — the primary interface for submitting search queries and retrieving results.
- Web frontend — the browser-based interface for performing searches.

Monthly Uptime Commitment

ASCSearch commits to a monthly uptime of at least 95%, corresponding to no more than approximately 36 hours of downtime per calendar month. Downtime during business hours (9am–9pm on working days) will be prioritised for rapid resolution.

Downtime is defined as a period of 60 or more consecutive seconds during which the service does not respond to search queries. Shorter interruptions do not count toward downtime.

The following are not counted as downtime:

- Scheduled maintenance, announced at least 48 hours in advance.
- Issues originating from the user's own network or device.

Incident Response

Response times apply during business hours, defined as 9am–9pm on working days.

Severity	Definition	Response time
Critical	Service fully unavailable	Within 1 business hour
High	Major degradation affecting most users	Within 4 business hours
Medium	Partial degradation or minor feature loss	Within 3 business days

Security Measures

All data in transit is encrypted using TLS. Access to production infrastructure is restricted to authorised team members. Known vulnerabilities in dependencies are monitored and patched on a regular basis.

Compliance Standards

ASCSearch is operated in accordance with the General Data Protection Regulation (GDPR) with respect to any personal data processed. No personal user data is sold or shared with third parties.

Service Level Objective (SLO)

ASCSearch targets the following internal objectives, monitored continuously via Prometheus and Grafana:

- Monthly uptime: $\geq 97-98\%$

Service Level Indicator (SLI)

The following measurements are used to evaluate whether the SLOs above are being met:

- The percentage of time the service has been reported as up by Prometheus over the last 30 days.

Current measured uptime over the last 30 days, as reported by Prometheus:

```
avg_over_time(up{job="cadvisor"}[30d]) * 100 = 96.35%
```

This figure reflects real uptime observed in the production environment and is used as the baseline for evaluating compliance with the SLO.
